Appn. No. 09/991,594 Unit 3732 (De Luca)

ABSTRACT OF THE DISCLOSURE

The invention of the Personal Denture Remover solves a problem (the inability of most, if not all, denture users to easily remove their own dentures) that was never before resolved. The invention provides a convenient, useful and easy advantage that was never before offered to denture users, and it solved a long-felt, long-existing need. The invention is an article of a material, such as metal or plastic, shaped or bent into a loop or ring, for the insertion of a denture user's finger at one end and a contoured hook at the other end, which is to be inserted over a user's dentures for the easy removal of the dentures from the user's mouth. At the tip of the hook, there is a unique feature, a tiny, 1/2 ball, rounded to avoid injury to the tender gum area. This is the novel and distinguishing feature of my invention.
